

Real Estate CRM - PRD

Real Estate CRM — Product Requirements Document

1. Overview

A CRM system for a real estate business that captures leads from Facebook, distributes them to sales team members, and tracks the full lead lifecycle — from first contact to deal closure and payment collection. The system has two panels: **Admin Panel** and **Team (Sales) Panel**.

2. User Roles

Role	Access
Admin	Receives all incoming leads, assigns/distributes leads to sales persons, views performance reports for all sales persons
Sales Person (Team)	Views only leads assigned to them, updates lead status, logs calls, records payments received from clients

3. Lead Source — Facebook Integration

- CRM connects to the business’s Facebook Page/Ads account.
 - When a person fills a Facebook Lead Ad form, the lead (name, phone, email, form answers) is automatically pulled into the CRM in real time.
 - All new leads land in the **Admin Panel** first.
-

4. Admin Panel

4.1 Lead Inbox

- All leads coming from Facebook appear here first, unassigned.
- Each lead shows: name, phone number, email, source form, date/time received.

4.2 Lead Distribution

- Admin assigns each lead to a specific sales person.
- Options to support:
 - Manual assignment (admin picks the sales person)
 - Round-robin auto-assignment (optional, distributes new leads evenly across active sales persons)
- Once assigned, the lead disappears from the unassigned inbox and appears in that sales person’s panel.

4.3 Sales Person Performance Dashboard (Monthly)

For each sales person, Admin can view: - Total leads received - Total leads converted (deal closed) - Number of site visits done - Total time spent on calls with leads (call hours) - Number of calls made - Lead status breakdown (Hot / Warm / Cold) - Funnel breakdown (Interested → Site Visit Done → Deal Closed) - Total sales value closed and total payments collected

4.4 Transactions View

- Admin can view all payment/transaction entries logged by every sales person, across all deals.
 - Filter by sales person, client, date range, deal.
 - Download/export all transactions.
-

5. Team (Sales Person) Panel

5.1 Dashboard

- Shows all leads assigned to that sales person only.
- For each lead: name, contact info, source, date assigned, current status.

5.2 Lead Categorization

- Sales person can mark each lead as:
 - **Hot Lead**
 - **Warm Lead**
 - **Cold Lead**

5.3 Lead Status Funnel

Each lead moves through a funnel with the following stages: 1. **Interested** 2. **Site Visit Done** 3. **Deal Closed**

- Sales person updates the lead's current stage manually as it progresses.
- A lead can also be marked as **Lost/Dropped** at any stage (recommended addition — flag this with the client if needed, not explicitly requested but needed for a complete funnel).

5.4 Call Logging

- Sales person can log each call/interaction made with a lead against that lead's record (notes on the conversation).

5.5 Payment / Transaction Entry

When a deal is closed (fully or partially), the sales person can log payment entries against that deal:

Field	Details
Deal amount (X)	Total agreed deal value
Amount paid (Y)	Amount client has paid so far
Date	Auto-captured (system date/time), not manually entered
Payment mode	UPI / Cash / Net Banking / Cheque / RTGS
Reference number	Required for UPI, Net Banking, Cheque, RTGS (not required for Cash)

- Multiple payment entries can be added over time against the same deal (since clients pay in installments).
 - Running balance (deal amount — total paid so far) is shown against each deal.
 - Sales person can **download all transactions** logged by them till date.
-

6. Core Data Entities

- **Lead:** name, phone, email, source, date received, assigned sales person, category (hot/warm/cold), funnel stage, status (active/lost)
 - **Sales Person:** name, login, assigned leads, call logs, performance stats
 - **Call Log:** lead ID, sales person ID, date/time, duration, notes
 - **Transaction:** deal ID, lead/client, amount paid, payment mode, reference number, date, logged by (sales person)
-

7. Reports & Exports

- Admin: monthly performance report per sales person (leads, conversions, site visits, call hours)
 - Admin & Sales Person: downloadable transaction history (all payments, filterable)
-

8. Open Questions — Answered

Q1. How is a lead connected between Admin and the Sales Person?

Normal language: Every lead has an “assigned to” tag. When Admin assigns a lead to a sales person, that tag is set to that sales person’s name. The sales person’s panel simply shows only the leads where the tag matches their own account. If Admin reassigns the lead to someone else, it disappears from the first person’s list and shows up for the new person.

Technical language: Each Lead record has a foreign key `assigned_to` referencing the Sales Person’s user ID. The Sales Panel queries leads with `WHERE assigned_to = current_user_id`. Reassignment is simply an update to that foreign key, with a history log (`lead_assignment_history` table) maintained for audit purposes.

Q2. How is “call hours” / time spent on calls recorded?

Normal language: There are two ways to do this: 1. **Manual logging** — after a call, the sales person taps a button and enters how long the call lasted (or the system asks “start call” / “end call” and calculates the time automatically). 2. **Automatic logging** — if the CRM is connected to a calling system (like a click-to-call service or a business phone/IVR system), the call duration is captured automatically the moment the call happens, with no manual entry needed.

Manual logging is simpler and cheaper to build first; automatic logging requires integrating a telephony/calling service and is more accurate but adds cost and setup (SIM/DID numbers, calling API subscription, etc.).

Technical language: - *Manual mode:* Sales panel has a “Log Call” action on each lead → captures `start_time`, `end_time` (or direct duration input) and free-text notes → stored in `call_logs` table linked to `lead_id` and `sales_person_id`. Duration = `end_time - start_time`. - *Automatic mode:* Integrate a cloud telephony/click-to-call API (e.g., Exotel, Knowlarity, Twilio, MyOperator). When a sales person calls a lead from within the CRM, the call is routed through the telephony provider, which sends a webhook back to the CRM with `call_id`, `duration`, `recording_url`, and `status` (answered/missed) once the call ends. This is auto-inserted into `call_logs` — no manual entry, and it’s tamper-proof for reporting.

Decision needed from you: Do you want manual entry (faster/cheaper to build) or automatic call tracking via a telephony provider (more accurate, needs a calling service subscription)?

Q3. How does the funnel/lead status actually work?

Normal language: Think of it as a checklist a lead moves through: first they’re “Interested,” then once they visit the property it becomes “Site Visit Done,” and finally when they sign/pay it becomes “Deal Closed.” The sales person just updates this stage as things progress — it’s not automatic, since only the sales person knows what actually happened with the client.

Technical language: `lead.funnel_stage` is an enum (`INTERESTED` , `SITE_VISIT_DONE` , `DEAL_CLOSED` , and optionally `LOST`). Updated via a dropdown/action in the Sales Panel, with each change written to a `lead_status_history` table (stage, changed_by, timestamp) so Admin's reports can calculate time-in-stage and conversion rates accurately.

Q4. How does the Facebook lead connection work?

Normal language: Facebook has a feature called "Lead Ads" — when someone fills the form on your Facebook ad, Facebook can automatically send that person's details straight to your CRM within seconds, so no one has to manually copy-paste leads from Facebook.

Technical language: Integration via the **Facebook Graph API / Lead Ads webhook**. The CRM subscribes to the `leadgen` webhook for the connected Facebook Page. On form submission, Facebook sends a webhook payload with a `leadgen_id` ; the CRM calls the Graph API to fetch full lead field data and inserts it as a new unassigned Lead record in real time.

Q5. How is the payment date captured "automatically"?

Normal language: The sales person doesn't type the date — the system just stamps today's date and time the moment they save the payment entry, so there's no chance of a wrong or fake date being entered.

Technical language: The `transaction.created_at` field is set server-side using `NOW()` /system timestamp at the time of `INSERT` , not accepted as user input from the client side — preventing manual backdating.

Q6. Who can edit/delete a transaction once entered?

Not specified in the requirements — needs your decision. Two options: - Transactions are locked once saved (edits require Admin approval) — recommended for financial integrity. - Sales person can freely edit their own entries.
